

Waypoint Advisory Business Continuity Solutions

Continuity Program Auditor

The Continuity Program Auditor is a cost-effective software tool enabling organizations to understand their relative levels of readiness for sustaining business operations in case of disaster, and provides the ability to continuously monitor, assess, and fine-tune their business continuity and disaster recovery program.

A user interacts with the database and its content of some 250 business continuity best-practices, identifies their organization's position relative to those practices, prioritizes specific areas for further attention, annotates and assigns take-aways for follow up actions, manages assigned tasks, generates management reports, and maintains a status of open items requiring attention for achieving acceptable levels of business continuity.

There are fifteen continuity categories containing "audit items"...critical business continuity practices that address areas such as program and plan attributes, business impact identification, vulnerabilities and risk, disaster recovery strategies, emergency response procedures, and continuity practices associated with all crucial business components including personnel, data, computer and network technology, voice communications, office infrastructure, and vital records. In addition, a user of the Continuity Program Auditor can define their own "audit items" with focus on their organization's specific business activity.

The Professional Edition provides support for numerous entities/locations, so that a BC professional can conduct audits across a distributed environment, or a consultancy can conduct continuity program reviews for multiple clients.

The Continuity Program Auditor provides significant value for any size organization, operating in any sector. Organizations with a continuity program and plan already in place can assess its contents against the Auditor's practices and suggestions...those without any business continuity plan can start the development process by taking advantage of the Auditor's content and recommendations.
